

# Diet Problems

*Text Reference: Section 1.10, p. 93*

The purpose of this set of exercises is to provide examples of vector equations which result from balancing nutrients in a diet.

Section 1.10 shows how use a vector equation

$$x_1\mathbf{a}_1 + x_2\mathbf{a}_2 + \dots + x_n\mathbf{a}_n = \mathbf{b}$$

to model a diet with a specified nutritional intake. Each vector  $\mathbf{a}_i$  lists the nutrient composition of one unit (usually 100 grams) of foodstuff, and the corresponding weight is the variable that represents the amount (number of units) of that foodstuff to be used in the diet. The vector  $\mathbf{b}$  lists the amount of each nutrient that must be in the diet.

Table 2 below is a listing of the nutritional value of many foods found in a typical kitchen. The nutrients are given per 100 grams of foodstuff. This data is taken from the USDA Nutrient Database for Standard Reference available at the United States Department of Agriculture website, <http://www.nal.usda.gov/fnic/foodcomp>. The columns represent respectively the following foodstuffs: beef, brussels sprouts, carrots, chicken soup, egg, feta cheese, grapefruit, lentils, lettuce, milk, mushrooms, oil, onion, rice, salad dressing, salmon, soy sauce, spinach, tomato, and vanilla ice cream. Table 1 gives the standard serving size for each of these foodstuffs, and also gives a key to the columns in Table 2.

Key Number	Foodstuff	Serving Size
1	Beef	6 oz. = 170 g
2	Brussels Sprouts	1/2 cup = 78 g
3	Carrots	1 carrot = 61 g
4	Chicken Soup	1 cup = 240 g
5	Egg	1 egg = 61 g
6	Feta Cheese	1/4 cup = 38 g
7	Grapefruit	1/2 fruit = 123 g
8	Lentils	1 cup = 198 g
9	Lettuce	1/2 cup = 28 g
10	Milk	1 cup = 244 g
11	Mushrooms	1/2 cup = 35 g
12	Oil	1 Tbsp. = 13.5 g
13	Onion	1 onion = 110 g
14	Rice	1 cup = 158 g
15	Salad Dressing	1 cup = 250 g
16	Salmon	1/2 fillet = 124 g
17	Soy Sauce	1 Tbsp. = 18 g
18	Spinach	1 cup = 180 g
19	Tomato	1 tomato = 123 g
20	Vanilla Ice Cream	1/2 cup = 66 g

Table 1: Serving Sizes of Various Foodstuffs

Table 2: Nutritional Values of Various Foods per 100 g of Foodstuff

**Questions:**

1. Low carbohydrate diets are popular for weight loss. Compute (by hand) the amount of carbohydrates in each of the following dishes, and determine which would be better for such a dieter to choose. You will first need to use Table 1 to convert the kitchen measures into 100 gram units, then use Table 2 to find the amount of carbohydrates in each ingredient.

Spinach omelet: 1/4 cup spinach, 2 eggs, 1/8 cup milk, 1/2 Tbsp. oil

Greek salad: 1 cup lettuce, 1/4 cup feta cheese, 1/2 of a tomato, 1/8 cup salad dressing

2. To make a stir fry, fry beef and onions in a wok with oil, and top it with soy sauce.
- You would like to make a stir fry with a total of 6 g carbohydrates, 50 g protein, and 3.5 mg vitamin C, and you'd like this dish to contain only 575 calories. Use Table 2 to set up a matrix equation which could be used to determine whether it is possible to make such a stir fry. Describe the steps you take to produce the vectors in the equation.
  - Find a precise recipe for the stir fry in part a). Convert your amounts to common kitchen measures using Table 1.
3. Table 2 has been incorporated into the matrix A in the m-file **diet.m** accompanying this file.

215	39	43	73	152	263	30	116	14	61.44	25	884	38	130	448.8	149	60	23	21	201

What does the  $j$ th column in this matrix represent? Which entry in this matrix tells you how much vitamin C is found in 100 g of vanilla ice cream?

4. A particularly math-savvy sumo wrestler wanted to adhere to a strict diet to maintain his weight and strength. Table 3 lists his desired nutritional intake for one day. The entries in Table 3 are stored in the vector **v<sub>1</sub>** which is in the m-file **diet.m**. Using Table 2 he was able to decide on an optimal diet to give him this combination of nutrients. How much of each of the above foods were in his diet?

Nutrient	Amount
Calories	8279.12 kcal
Protein	608.81 g
Fat	387.6 g
Carbohydrates	604.48 g
Calcium	4067.42 mg
Iron	93.34 mg
Magnesium	1714.73 mg
Phosphorus	8488.03 mg
Potassium	18023.48 mg
Sodium	8846.38 mg
Zinc	36009.75 mg
Copper	6.67 mcg
Vitamin C	604.06 mg
Thiamine	6.77 mg
Riboflavin	10.61 mg
Niacin	28212.10 mg
Pantothenic Acid	103.11 mg
Vitamin B6	189.81 mg
Vitamin B12	51.78 mcg
Vitamin A	95382.93 IU

Table 3: Sumo Wrestler Diet

```
v = [8279.12, 608.81, 387.60, 604.48, 4067.42, 93.34, 1714.73,
8488.03, 18023.48, 8846.38, 36009.75, 6.67, 604.06, 6.77,
10.61, 28212.10, 103.11, 189.81, 51.78, 95382.93];
```

5. The United States Food and Drug Administration (FDA) provides Recommended Daily Values for use on food labels. Table 4 gives the FDA's recommendations, which are also stored in the vector `v2` which is in the accompanying m-file `diet.m`. Is it possible to combine the foods from the table to approximate these nutritional values?

<b>Nutrient</b>	<b>Amount</b>
Calories	2000 kcal
Protein	50 g
Fat	65 g
Carbohydrates	300 g
Calcium	1000 mg
Iron	18 mg
Magnesium	400 mg
Phosphorus	1000 mg
Potassium	3500 mg
Sodium	2400 mg
Zinc	15 mg
Copper	2000 mcg
Vitamin C	60 mg
Thiamine	2 mg
Riboflavin	2 mg
Niacin	20 mg
Pantothenic Acid	10 mg
Vitamin B6	2 mg
Vitamin B12	6 mcg
Vitamin A	5000 IU

Table 4: FDA Recommended Daily Values

```
v2 = [2000 50 65 300 1000 18 400 1000 3500 2400 15 2000 60
      2 2 20 10 2 6 5000];
```
