

How would you improve mathemalchemy? This question is a hard one to answer. I think the way that I would start is by bringing more focus to the people, I'm a sociology major so I spend a lot of time thinking about people and society as a whole. I would try to properly fit this piece of the puzzle into society. Perhaps I would bring up a one to one correspondence in response to a crisis going on in the world (one meal to one citizen). I could maybe propose the benefits about teaching mathemalchemy in schools.

The way we could improve mathemalchemy is by teaching it to the younger generation or by properly integrating it in to society. Sociology looks at all the moving parts of society. Sociology is looking at the bigger picture and after spending a semester in mathemalchemy I have realized how similar the two are. There is no improvements needed to mathemalchemy just the suggestions I have given above.
