Result Text (continued)

Study Result

The patient is here for a hearing screening. His last test was completed in 2019.
A normal sloping to moderately severe configuration was present in BOTH ears. The Left ear was slightly worse at 750 Hz and 1 K.
Previously his results were the same configuration but not much of a difference at 750 Hz and 1K.
Not much difference in speech testing for the RIGHT ear the LEFT ear as slightly gotten better in WRS's.
The test results were reviewed with the patient.
